

# Report on IYNC 2022 (VI)

The International Youth Nuclear Congress is a biennial nuclear event for students and young professionals. This year, the event takes place in the Japanese city of Koriyama. This year's theme was "You are the Core". This theme therefore suggests putting the human element at the heart of the discussion about nuclear in various fields (R&D, health, waste management, low carbon energies...).

The event lasted for a week, with many talks during the Keynotes, Panel sessions, technical tracks... The program was very rich and varied, but if I had to remember only one thing, it would be surely the presentation of the Tepco website "inside Fukushima Daiichi" with the virtual tour of the electricity production site. It made us realize all the efforts and means implemented for the decommissioning of the area, the management of tritiated water and the dismantling of the nuclear reactor.

This event also hosted the final of the international innovation contest I4N. This contest hosted 6 teams from 3 different continents. All these teams won a local innovation contest, and all presented brilliant ideas about innovations in the nuclear field. Participate at this contest with my teammates was an incredible experience, which, beyond the development of our project Navigatom, was a journey rich in encounters and learning.

I especially thank my company, the ENS-YGN and Oakridge SAS for supporting my trip and give me the opportunity to experience this event, which, I hope, is the first one on a long list.
